                                                                                                                                                                                                                                                                                                                                                                                                        PTM: Proteolytically cleaved by caspases during apoptosis. Cleaved efficiently at Asp-123 by caspase-6 and granzyme B. Cleaved with approximately 10-fold less efficiency at Asp-109 by caspase-3 and caspase-7 (By similarity).

MISCELLANBOUS: In strain C57BL/Ola, an 85-kb region on chromosome 4 containing Numat and Ube4b is triplicated. Ube4b becomes linked to Numat and encodes a fusion protein located in the nucleus which is responsible for the delayed Wallerian degeneration of injured
FUNCTION: Binds to the ubiquitin moleties of preformed conjugates and catalyzes ubiquitin chain assembly in conjunction with E1, E2, and E3 (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          -!- SIMILARITY: BELONGS TO THE UBIQUITIN CONJUGATION FACTOR E4 FAMILY

                                                                                                                                                                                                               Isode-095155-3; Sequence=VSP_007101, VSP_007102, VSP_007103;
Note=No experimental confirmation available;
TISSUE SPECIFICITY: Highest expression in ovary, testis, heart and skeletal muscle. Expression is low in colon, thymus and peripheral blood leukocytes. Almost undetectable in lung and spleen.
PTM: Proteolytically cleaved by caspases during apoptosis. Cleaved efficiently at Asp-123 by caspases during apoptosis. Cleaved approximately 10-fold less efficiency at Asp-109 by caspase-3 and
FUNCTION: Binds to the ubiquitin moleties of preformed conjugates and catalyzes ubiquitin chain assembly in conjunction with E1, E2, and E3 (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              D->A: ABOLITION OF CLEAVAGE BY CASPASE-6.
NO EFFECT ON CLEAVAGE BY GRANZYME B.

Murification and characterization of a vimentin-specific protease in mouse myeloid leukemia cells. Regulation during differentiation and identity with cathepsin G.";

Bur. J. Blochem. 205:1947-994 (1992).

Fur. J. Blochem. 205:1947-994 (1992).

-I- FUNCTION: This vimentin filaments; occurring during cell differentiation of vimentin filaments; occurring during cell differentiation, movement and mitosis.

-I- CATALYTIC ACTIVITY: Specificity similar to chymotrypsin C.

-I- SUBCELLULAR LOCATION: STRONGIY ASSOCIATED WITH MEMBRANES.

-I- SIMILARITY: Belongs to peptidase family S1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Mus musculus (Mouse).

The Arabidopsis thaliana apurinic endonuclease Arp reduces human transcription factors Fos and Jun.";

Transcription factors Fos and Jun.";

Proc. Natl. Acad. Sci. U.S.A. 91:3299-3303(1994).

Tedox factor: Is multifunctional and may be involved both in DNA repair and in the regulation of transcription.

Tedox factor: Is multifunctional and may be involved both in DNA repair and in the regulation of transcription.

Tedox factor: The C-O-P bond 3' to the apurinic or apprinted in DNA is broken by a beta-elimination reaction, leaving a 3'-terminal unsaturated sugar and a product with a perminal 5'-phosphate.

Terminal 5'-phosphate.

TESUE SPECIFICITY: Expressed in the siliques, flowers, and stems.

High level expression is seen in the leaves.

High level expression is seen in the leaves.

SEMILARITY: Contains 1 SAP domain.
                                                                                                                                                                                                                                                                                                       Gaps

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Saldanha J, Kolbinger F, Hardman N; WPI; 1999-570765/48. new method for determining IgE levels in a sample.

Claim 5; Col 67; 19pp; English.

The invention relates to a method of determining IgE levels in a body fluid sample, by contacting the sample with a reshaped human monoclonal antibody (RA) having a binding affinity about equal to that of the murine CDR-donor antibody TES-C21 produced by the cell line 11133. The antibodies are useful in the diagnosis, prophylaxis and treatment of allergy. This sequence represents the complementarity determining region (CDR) 1 from the light chain variable domain of a reshaped human antibody

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence is the hypervariable region CDR1 (complementarity determining region 1) of the light chain of a single chain antibody derived from the murine antibody 225. The invention relates to a method for inhibiting the growth of tumours in human patients by treating with an effective amount of a combination of radiation and a non-radiolabelled protein receptor tyrosine kinase (PRTK) inhibitor, the overexpression of which can lead to tumourigenesis. The method can be used in the treatment of tumours of e.g. breast, lung, colon, kidney, bladder, head and neck, ovary, prostate or brain. The administration of a suitable antibody to the patient makes the tumour more susceptible to radiotherapy
                                                                                                                                                                                                                     Hypervariable region; complementarity determining region; CDR; tumour; single chain antibody; growth inhibitor; human; tumourigenesis; therapy; protein receptor tyrosine kinase; light chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Treatment of human tumors, using a combination of radiation and a non-radiolabeled protein receptor tyrosine kinase inhibitor.

This invention relates to a method for inhibiting the growth of refractory tumours that are stimulated by a ligand of epidernal growth factorized to receptor (EGFR) in human patients. The method involves treating the patient with a combination of EGFR/Human EGF-1 (HER1) antegonist, optionally with a chemotherapeutic agent or radiation. The antagonist can be for example a chimeric anti-EGFR monoclonal antibody, C225. The CC EGFR/HER1 antagonist is useful for inhibiting the growth of refractory tumours such as tumours of breast, heart, lung, small intestine, colon, Eplem, kidney, bladder, head and heart, ovary, prostate, brain, pancreas, skin, bone, bone marrow, blood, thymus, uterus, testicles, cervix and liver, preferably squamous cell carcinomas. The present sequence region complementarity determining region 1 amino acid sequence of the chimeric anti-EGFR monoclonal antibody C225 which is used in an example illustrating the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                               Epidermal growth factor receptor/human epidermal growth factor receptor-1 antagonist for inhibiting the growth of refractory tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Mouse, light chain, antibody, hyperproliferative disease, epidermal growth factor, EGF, psoriasis, actinic keratosis, seborrheic keratosis, warts, keloid scars, eczema, 255 antibody,

```
New single chain polypeptide that binds to epidermal growth factor receptor - is derived from antibody 14E, used for treatment and diagnosis of cancer or other cell proliferative diseases.
                                                                                                                                                                                                                                                                                                                                    The present sequence represents the light chain variable domain of murine monoclonal antibody 14E1. This antibody is active against the human epidermal growth factor receptor (EGF-R). The sequence is used to construct a single-chain polypeptide (scFv) that has binding affinity for an EGF-R. The scFv comprises two segments which contain the binding parts of the heavy and light chain variable domains of the monoclonal antibody 14E1. The scFvs of the invention used to cardinomas (gliomas, melanomas and tumours) that overexpress EGF-R, specifically EGF-RVIII, relative to normal cells, particularly by blocking proliferation of such vitro purging. When the scFv is appropriately labelled, it can be used diagnostically to image cells that express EGF-R, specifically breast
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antibody; heavy chain; light chain; variable region; therapy; constant region; prophylaxis; prevention; allergy; identification; allergic reaction; immunoglobulin; IgE; determination.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to a novel method for treating a mammal with the hyperproliferative disease stimulated by a ligand of a member of the epidermal growth factor (BGF) family of receptors. The method involves caministering an antibody or a defective receptor that is an antagonist of a member of the EGF receptor family, or a combination of the antagonist and phototherapy, chemotherapeutic agent or radiation therapy. The antibody used in the method of the invention acts as an epidermal growth factor receptor (BGFR) antagonist by inhibiting EGFR /HERL phosphorylation. The method of the invention is useful for treating a mammal with hyperproliferative disease such as psoriasis, actinic keratoses, seborrheic keratoses, wartes, keloid scars and eczema stimulated by a ligand of a member of the EGF family of receptor. This sequence represents the murine anti-EGF 255 antibody light chain (LH) the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                Treating a mammal with hyperproliferative disease especially psoriasis, stimulated by ligand of member of epidermal growth factor family of receptors, by administering antagonist of the receptor.

Kappa, light chain, reshaped, monoclonal; antibody; 225RA; human; cell; epidermal growth factor; EGF; receptor; inhibition; growth; tumour; cell; late stage; prostatic; prostate; variable region; framework; complementarity determining region; CDR.
                                                                                                                                                                                                               Chimeric and humanised versions of anti-EGF receptor antibody 225 - used for inhibiting tumour growth, esp. of late stage prostatic tumour.
                                                                                                                                                                                                                                                                             The present sequence is the kappa light chain variable region of the reshaped human monoclonal antibody (MAD) H225, 225RKA. The MAD is specific for the human epidermal growth factor (EGF) receptor. The MAD, or a fragment, can be used to inhibit the growth of tumour cells, especially late stage prostatic tumour cells in humans, optionally conjugated to a cytocoxic agent, especially doxorubicin, taxol or cisplatin, or a signal transduction, ras or cell cycle inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                    100.0%; Score 55; DB 2; Length 107; 100.0%; Pred. No. 0.0032; ative 0; Mismatches 0; Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Kappa; light chain; reshaped; monoclonal; antibody; 225RB; human; epidermal growth factor; EGF; receptor; inhibition; growth; tumour; cell; late stage; prostatic; prostate; variable region; framework; complementarity determining region; CDR.
                                                                                                                                                                                                                          Reshaped human monoclonal antibodies can be used in the prophylaxis and/or treatment of allergic reactions in humans. The monoclonal antibodies can also be used for the qualitative or quantitative determination of IgE and for the determination of surface IgE positive B cells. They can provide a long lasting therapeutic effect without inducing immunogenicity as foreign proteins. The CDK's from the variable heavy and light chains of the murine antibody TES-C21 were used in the construction of a molecular model of the variable heavy and light chains of a human reshaped antibody which also comprised human variable heavy and light chain framework regions. (Updated on 25-MAR-2003 to correct PN field.)

The invention relates to a method of determining IgE levels in a body fluid sample, by contacting the sample with a reshaped human monoclonal antibody (RA) having a binding affinity about equal to that of the murine CDR-donor antibody TES-C21 produced by the cell line 11133. The antibodies are useful in the diagnosis, prophylaxis and treatment of allergy. This sequence represents the light chain variable domain from the TES-C21 antibody. The fragments encoding the complementarity determining regions are used to generate the reshaped antibodies of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present protein sequence is the Vkappa (kappa chain variable region) of the humanised antibody Hu-901. This is an exemplary anti-1gE (anti-immunoglobulin E) monoclonal antibody produced by hybridoma TES-C21. The heavy and light chains are obtained through RT-PCR using the RNA from the transfectorian cell line producing the chimeric antibody. Humanised anti-IEB genes are incorporated in the genome of a recombinant adenovirus vector as an independent transcriptional unit, and packaged into infections virus particles. Upon infection of host, the recombinant adenovirus vector will direct the production of either intext anti-IgE antibody or an scFv fragment in the serum, which will bind free
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Humanised antibody-901, Hu-901; Vkappa; kappa chain variable region; anti-19g; anti-1egional antibody; hybridoma TES-C21; recombinant adenovirus vector; anti-19g antibody; gene therapy; scFv; single chain variable fragment; allergy; antiallergic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acids encoding anti-IgE antibodies such as Hu-901 or their fragments, useful in the gene therapy of allergic diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is the kappa light chain variable region of the reshaped human enoclonal antibody (Wab) H225. 225RA, The Mab is specific for the human epidermal growth factor (EGF) receptor. The Mab, or a fragment, can be used to inhibit the growth of tumour cells especially late stage prostatic tumour cells in humans, optionally conjugated to a cytocoxic agent, especially doxorubicin, taxol or cisplatin, or a signal transduction, ras or cell cycle inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Reshaped human monoclonal antibodies can be used in the prophylaxis and/or treatment of allergic reactions in humans. The monoclonal antibodies can also be used for the qualitative or quantitative determination of IgS and for the determination of surface IgS positive B cells. They can provide a long lasting therapeutic effect without inducing immunogenicity as foreagn proteins. This sequence is a slightly modified version of C21-L1 described in ARE50187, having glutamic acid at position 1 of the mature protein instead of aspartic acid and value at
circulating IgE, resulting in the reduction of free serum IgE. The binding of the antibody or fragment to IgE-bearing B cells may lower IgE levels by down-regulating IgE production by these B cells. These methods are useful in the gene therapy of allergic diseases
                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New reshaped human monoclonal antibody specific for IgE - used for prophylaxis or treatment of allergic reactions or qualitative or quantitative determn. of IgE.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Reshaped human monoclonal antibodies can be used in the prophylaxis and/or treatment of allergic reactions in humans. The monoclonal antibodies can also be used for the qualitative or quantitative determination of IgE and for the determination of surface IgE positive cells. They can provide a long lasting therapeutic effect without inducing immunogenicity as foreign proteins. (Updated on 25-MAR-2003 to correct PA field.) (Updated on 25-MAR-2003 to correct PA field.)
position 3 of the mature protein instead of leucine (positions 21 and respectively of this sequence). (Updated on 25-MAR-2003 to correct PN field.)

The monoclonal antibodies can also be used for the qualitative or quantitative determination of IgE and for the determination of surface IgE positive B cells. They can provide a long lasting therapeutic effect without inducing immunogenicity as foreign proteins. This sequence is a slightly modified version of C21-L1 described in AAR50187, having aspartic acid at position 60 of the mature protein (position 80 of this sequence) instead of serine. (Updated on 25-MAR-2003 to correct PM field.) (Updated on 25-MAR-2003 to correct PM field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is the kappa light chain variable region of the chimeric monoclonal antibody (MAb) C225, with the modified leader sequence from the kappa light chain of L7.CL MAb. C225 is specific for the human epidermal growth factor (EGF) receptor. C225, or a fragment, can be used to inhibit the growth of tumour cells, especially late stage special tumour cells in humans, optionally conjugated to a cytotoxic agent, especially doxorubicin, taxol or cisplatin, or a signal transduction, ras or cell cycle inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Chimeric and humanised versions of anti-EGF receptor antibody 225 - used for inhibiting tumour growth, esp. of late stage prostatic tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                         Chimeric and humanised versions of anti-EGF receptor antibody 225 - used for inhibiting tumour growth, esp. of late stage prostatic tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is the kappa light chain variable region of the murine monoclonal antibody (MAb) M225, which is specific for the human epidermal growth factor (EGF) receptor. The MAb, or a fragment, can be used to inhibit the growth of tumour cells, especially late stage prostatic tumour cells in humans, optionally conjugated to a cytotoxic agent, especially doxorubicin, taxol or displatin, or a signal transduction, ras or cell cycle inhibitor. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                     Kappa light chain variable region of M225 antibody.
                                                                                                                                                                                                                                                                                                                                                                                   Saldanha JW;

CLASSIFICATION:
ATTORNEY/AGENT INPORMATION:
NAME: SYENSSON, LECNARD R
REGISTRATION NUMBER: 30,330
REFERENCE/DOCKET NUMBER: 20-3484
TELECOMMUNICATION INFORMATION:
TELEPAK: (703) 205-8050
TELEPAK: (703) 205-8050
TELEPAK: (703) 205-8050
INPORMATION FOR SEQ ID NO: 5:
SEQUENCE CHARACTERISTICS:
LENGTH: A mino acids
TYPE: amino acids
STRANEDNESS: not relevant
      TOPOLOGY: linear
MOLECULE TYPE: peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

Patent No. 6066718

GENERAL INFORMATION:
APPLICANT: Hardman, No. 6066718man
APPLICANT: Saldanha, Jose
TITLE OF INVENTION: Reshaped monoclonal antibodies against an
TITLE OF INVENTION: immunoglobulin isotype
NUMBER OF SEQUENCES: 55

CORRESPONDENCE ADDRESS:
ADDRESSER: No. 6066718artis Patent and Trademark Department
STREET: 59 Route 10
CITY: East Hanover
                                                                                                                                      GENERAL INFORMATION:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 8, Application US/08476176B
Patent No. 5958708
GENERAL INFORMATION:
APPLICANT: Hardman, No. 5958708man
APPLICANT: Kolbinger, Frank
APPLICANT: Saldanha, Jose
TITLE OF INVENTION: Reshaped monoclonal antibodies against an
APPLICANT: Saldanha, Jose
TITLE OF INVENTION: Reshaped monoclonal antibodies against an
TITLE OF INVENTION: immunoglobulin isotype
NUMBER OF SEQUENCES: 55

Treatment of human tumors, using a combination of radiation and a non-radiolabeled protein receptor tyrosine kinase inhibitor.

Disclosure; Page 15; 31pp; English.

This sequence is the hypervariable region CDR2 (complementarity determining region 2) of the light chain of a single chain antibody deterived from the murine antibody 225. The invention relates to a method for inhibiting the growth of tumours in human patients by treating with an effective amount of a combination of radiation and a non-radiolabelled protein receptor tyrosine kinase (RRTK) inhibitor, the overexpression of which can lead to tumourigenesis. The method can be used in the treatment of tumours of e.g. breast, lung, colon, kidney, bladder, head and neck, ovary, prostate or brain. The administration of a suitable antibody to

AAU77788 standard; peptide; 6 AA.

The method involves treating the patient with a combination of EGFR/human EGF-1 (HERI) antagonist, optionally with a chemotherapeutic agent or radiation. The antagonist can be for example a chimeric anti-EGFR monoclonal antibody, C25. The EGFR/HERI antagonist is useful for inhibiting the growth of refractory tumours such as tumours of breast, heart, lung, small intestine, colon, skin, bone, bone marrow, hlood, thymus, uterus, testicles, cervix and liver, preferably squamous cell carcinomas. The present sequence liver, preferably squamous cell carcinomas. The present sequence region 2 amino acid sequence of the chimeric anti-EGFR monoclonal antibody C225 which is used in an example illustrating the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Epidermal growth factor receptor/human epidermal growth factor receptor-1 antagonist for inhibiting the growth of refractory tumors.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to a novel method for treating a mammal with hyperproliferative disease stimulated by a ligand of a member of the epidermal growth factor (EGP) family of receptors. The method involves administering an antibody or a defective receptor that is an antagonist of a member of the EGF receptor family, or a combination of the rantagonist and photocherapy, chemotherapeutic agent or radiation therapy. The antibody used in the method of the invention acts as an epidermal prosphorylation. The method of the invention is useful for treating a mammal with hyperpoliferative disease such as psoriasis, actinic structured by a ligand of a member of the EGF family of receptor. This sequence represents the murine anti-EGF 25s antibody light chain (LH) hypervariable region (CDR2) used as an inhibitor of EGFR in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Treating a mammal with hyperproliferative disease especially psoriasis, stimulated by ligand of member of epidermal growth factor family of receptors, by administering antagonist of the receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
